

Project Title:

Azure File Sync with an On-Premises File Server

Team Number: T175

Project Number: P073

Problem Statement:

Nowadays, a lot of companies save their files on local servers. But the more data there is, the more challenging it is to manage and store them correctly and keep backups. Our solution allows to resolve these challenges by connecting the local file server with the cloud storage (Microsoft Azure).

Objectives:

- To connect an on-premises file server to Microsoft Azure.
- To synchronize files in both ways between the local file server and Azure File Share.
- To be able to use cloud tiering to save space on the local file server for more crucial data.
- To enable users to manage increasing data in a highly scalable environment.
- To offer enhanced file management and data protection.
- To gain an insight into hybrid cloud storage through the practical example.

Use Cases:

- File sync: You will be able to synchronize your local files with remote files in the cloud storage.
- Cloud storage: With our solution, you can store extra files in Azure.
- Cloud tiering: Sync your frequently used files locally while storing your seldom accessed files in the cloud.
- Multiple Offices: You can manage and synchronize all your files between different offices.
- Backup: You can make the additional copy of your local files on Azure.
- Reduces On-premises Storage Growth

Requirements:

- Azure Free Trail
- Windows Server/VM
- Azure Storage Account
- Azure File Share
- Storage Sync Service
- Azure File Sync agent
- Internet connect
